## Makale Kodu (Article Code): KVFD-2009-1053

## Summary

This study was conducted to determine attitudes to the use of animals in research of Erciyes University students attending Faculties of Biology, Civil Engineering, Fine Arts and Veterinary Medicine in the 2005-2006 academic year. Seven hundred and thirty nine ( $82.2 \%$ ) of the 899 students enrolled in these faculties were reached by a survey. Several results were found: (a) Of all survey participants $59.1 \%$ displayed a zoocentric attitude (4>). (b) Male students ( $\mathrm{P}<0.001$ ), civil engineering students ( $\mathrm{P}<0.001$ ) and survey participants brought up in a town or district ( $\mathrm{P}<0.01$ ) displayed a more anthropocentric attitude and were in support of animal experiments. (c) The majority of the survey participants expressed their agreement with the opinion that compared to alternative (non-animal) methods, animal experiments are easier, more scientific, more common, less costly, and more reliable, whereas they also stated that they disagreed with the opinion that animal experiments are more humane.

Keywords: Animal experimentation, Animal use in researches, Animal ethics, Erciyes University

# Erciyes Üniversitesi Öğrencilerinin Araştırmalarda Hayvan Kullanımına Yaklaşımları 

## Özet

Bu çalışma, araştırmalarda hayvan kullanımı konusundaki tutumların belirlenmesi amacıyla, 2005-2006 öğretim yilında, Erciyes Üniversitesinin Biyoloji, İnşaat Mühendisliği, Güzel Sanatlar ve Veteriner Hekimliği bölümlerinde öğrenim gören öğrencilere anket uygulanarak gerçekleştirildi. Anket uygulaması kapsamında bu bölümlere kayıtll 899 öğrenciden 739'una (\% 82.2) ulaşıldı. Bulunan bazı sonuçlar: (a) Tüm katılımcıların \%59.1'i hayvan merkezli bir tutum (4>) sergiledi. (b) Erkek öğrenciler ( $\mathrm{P}<0.001$ ), İnşaat mühendisliği öğrencileri ( $\mathrm{P}<0.001$ ) ve kasaba/ilçe kökenli katılımcılar ( $\mathrm{P}<0.01$ ) diğer gruplara oranla daha insan merkezci tutum sergileyerek hayvan deneylerini desteklediler. (c) Katilımcıların daha büyük bölümü, hayvan deneylerinin alternatif yöntemlere oranla daha kolay, daha bilimsel, daha yaygın, daha ekonomik ve daha güvenilir olduğu yönündeki yargılara katıldıklarını, daha vicdani olduğu şeklindeki yargıya ise katılmadıklarını bildirdi.

## Anahtar sözcükler: Hayvan deneyleri, Araştırmalarda hayvan kullanımı, Hayvan etiği, Erciyes Üniversitesi

## INTRODUCTION

The use of animals in education and research has been a long-standing tradition for centuries ${ }^{1}$. However, this tradition has resulted in the abuse of animals in research. Particularly after World War II, exploding technological developments in biomedical sciences led to an increase in the number of experimental studies conducted and the number of animals used in these studies, with experimental animals reaching a peak in
the early 1970s ${ }^{2}$. The 1970s were, at the same time, a period in which animal rights were highly debated and in which the animal rights movement grew stronger by attracting the support of masses ${ }^{3}$. As a result, in particular, problems related to animal experiments became a major agenda item and law in many countries regulated the use of animals in research. Due to several reasons, including the impact of these developments, the increased use of
alternative methods and major advances in the field of genetic engineering, the number of animals used in research in the last 30 years has reduced significantly ${ }^{2,4,7}$.

Since the 1990s, a wealth of studies has been conducted in various countries across the world to determine the attitude of different segments of the society to animal experimentation ${ }^{4,8-13}$. In recent years, similar studies have also been carried out in Turkey to determine attitudes to animal experiments ${ }^{6,14}$; however, to the knowledge of the authors, no previous study exists on the determination of discrepancy in attitudes to animal experimentation between university students attending different faculties.

This study was aimed at the determination of the attitudes of Erciyes University students enrolled in the Faculties of Biology (B), Civil Engineering (CE), Fine Arts (FA) and Veterinary Medicine (VM) to the use of animals in research.

## MATERIAL and METHODS

In the present study, the survey of a total of 899 students at Erciyes University, enrolled in all classes of the Faculties of Biology ( 206 students), Civil Engineering (213 students), Fine Arts (186 students) and Veterinary Medicine (294 students), was aimed in the 2005-2006 academic year. The numbers of students were obtained from the Deanship of each Faculty.

The survey was presented to all groups at the end of the 2005-2006 academic year. The data were collected by a paper questionnaire.

The questionnaires were distributed to the students at the beginning of lectures and were filled in anonymously immediately after being distributed. The population was defined as all students who were part of the group present when the questionnaires were distributed.

The questionnaire was composed of three sections. Demographic information was collected in the first section. In this section, all participants were asked about five parameters that contained independent variables (faculty/department, class, gender, upbringing and pet ownership). The second section of the questionnaire included the "Set of Animal Use in Researches" (SAUR), comprising 15 items developed by Yerlikaya et al. ${ }^{6}$ using a 7-point Likert scale. Eight of the items of the SAUR were based on the zoocentric opinion, and seven of them were based on the anthropocentric opinion. In the third section of the questionnaire, the participants were asked six closed questions to compare the reasons of their preference between alternative methods and use of animals in research.

SPSS Version 13.0 for Windows was used for all statistical analyses. Frequencies were used for demographic analyses. When evaluating the second section, a mean rating was calculated for attitudes to the SAUR for each participant. The scoring of the items based on the zoocentric opinion was such that the response "strongly agree" was seven points and the response "strongly disagree" was one point. Furthermore, items based on the anthropocentric opinion were scored the direct contrary. The response "not sure" was scored four points for both opinions. When comparisons were made between groups for the SAUR, a score <4 was classified as disagreement with this set and interpreted as showing anthropocentric attitude toward animal use in researches. A score $\geq 4$ was interpreted as showing zoocentric attitude toward animal use in researches.
$P$ values were calculated for the parametric tests among groups. Independent Student's t-test was used to measure differences between groups for gender and pet ownership. Analysis of variance was used to determine differences for faculty/department, class and upbringing. Following these analyses, Duncan's test was applied for the group comparisons for the significant parameters. A chi-square test was used to determine differences between the groups in the responses given to the third section. $P$ values $<0.05$ were considered significant ${ }^{15,16}$.

## RESULTS

The overall response rate was $82.2 \%$ ( $n=739$ ). The distribution of the response rates of the participants for the variables faculty/department, gender, class, upbringing and pet ownership, is given in Table 1. According to the mean values obtained upon the scoring of the SAUR, $59.1 \%$ of the survey participants displayed a zoocentric attitude (4>).

Based on the scoring of the SAUR, students of FA, B and VM displayed a positive attitude (4>), and the attitude levels of these students were significantly higher than those of CE students ( $\mathrm{P}<0.001$ ) (Table 1). Among students of FA, B, VM and CE, the rates of those displaying a zoocentric attitude were $81.5 \%, 60.5 \%$, $54 \%$, and $46.2 \%$, respectively.

With respect to the gender variable, all students displayed a zoocentric attitude (4>). However, it was observed that the attitude level of female participants (4.36) was higher than that of male participants (4.02) ( $\mathrm{P}<0.001$ ) (Table 1).

Participants brought up in a metropolis, city or town displayed a zoocentric attitude (4>), while those brought

up in a village displayed an anthropocentric attitude (<4). Significant discrepancy was determined to exist in the attitudes of the participants with different upbringing ( $P<0.01$ ). Accordingly, students brought up in a city scored the SAUR higher than students brought up in a town or village (Table 1).

Differences determined in the attitudes of the participants for the variables pet ownership and class were statistically insignificant ( $P>0.05$ ).

In the last section of the questionnaire, the participants compared animal experiments and alternative methods for parameters of ease, technicality, cost, reliability, commonness and humaneness. Based on these responses, the majority of the participants agreed that compared to alternative methods, animal experiments were easier, more scientific, less costly, more reliable and more common but less humane (Table 2).

While no difference existed between students attending different faculties for the parameters of ease, cost, commonness and humaneness ( $\mathrm{P}>0.05$ ); differences were determined between the opinions of students enrolled in different faculties for the parameters of technicality and reliability ( $\mathrm{P}<0.05$ ). The highest rate of agreement with the opinion that animal experiments are more scientific and more reliable than alternative methods was determined among B students, while the lowest rate of agreement with the same opinion was determined among CE students (Table 3).

## DISCUSSION

In the majority of studies investigating attitudes to animal experiments and moral status of animals, it is seen that females display a higher rate of zoocentric attitude, compared to males ${ }^{4,6,8,9,11,12,17}$. This is also the case in the present study.

In several studies conducted on animal experiments ${ }^{6,9,12}$, it has been suggested that urbanization is related to the establishment of awareness to animal experiments. The results of this study are also in agreement with those of the aforementioned previous studies in that participants of urban origin displayed a more zoocentric attitude in comparison to participants of town or village origin.

In a study aimed at the determination of the opinion of university students on the use of animals in research, the majority of participants have displayed an attitude in favour of the use of animals in biomedical research ${ }^{6}$. According to the results of the present study, only twofifths of the participants displayed a positive attitude to the use of animals in biomedical research. This difference may be related to the enforcement of the Law on Animal Protection in 2004 and the influence of discussions brought up by the media on students. According to this law, in order to promote the protection and welfare of animals, programs aimed at general and formal education should be made and broadcasting time should be reserved for these issues on radio and television programmes.

Bowd and Boylan ${ }^{18}$ and Gallup and Beckstead ${ }^{19}$ suggest that university students with biology education, who are aware of the values of biomedical research, support animal experiments at higher rates, compared to other students. On the contrary, the results of the present study have demonstrated the number of the participants with zoocentric attitude to the use of animals
in biomedical research to be greater among biology and veterinary students, compared to engineering students. These results, which disagree with those, reported by Bowd and Boylan ${ }^{18}$ and Gallup and Beckstead ${ }^{19}$, are attributed to the higher possibility of students with biology education and thereby with better knowledge of animals being aware of the sentient character of animals. According to the results of the present study, the highest rate of zoocentric attitude being determined in students of Fine Arts compared to the other groups may be related to the compassionate nature of artists ${ }^{20}$; and in particular their radical-protective approach to the protection of the environment and living beings ${ }^{21}$.

Based on the results of a study conducted among students of veterinary, Yerlikaya et al. ${ }^{6}$ have reported that the majority of the participants share the opinion that in comparison to alternative methods, animal experiments are more reliable, less costly, easier, more common and less humane. The results of the present study are in agreement with those reported by Yerlikaya et al. ${ }^{6}$. Although, in general, alternative methods are considered to be easier and less costly than animal experiments ${ }^{22}$, and despite no consensus having been reached by researchers on the superiority of any of the two methods to the other with respect to parameters of "reliability" and "technicality" ${ }^{23}$, the majority of the participants of the present study being in favour of animal experiments with respect to the parameters of ease, cost, reliability and technicality can be accepted as an indicator of their inadequate level of information related to the issue. Both the results reported by Yerlikaya et al. ${ }^{6}$ and those obtained in the present study demonstrating the opinion that animal experiments are less humane than alternative methods, can be accepted as an indicator of the participants being in an ethical dilemma as regards animal experiments.

In conclusion, it can be suggested that students of Erciyes University, in general, displayed a zoocentric
attitude to the use of animals in biomedical research, and that differences in gender, origin and faculty influence significantly the attitude of participants. Furthermore, it can be stated that the participants did not have adequate information on animal experiments and alternative methods, and that they were in an ethical dilemma as regards animal experiments.
